ALTERATION OF DATE

The Application for Patent No. 190570 (555/MUM/2001) dated 18-06-2001 has been ante-dated to 06-03-2000 Under Section 16 of the Patents Act, 1970.

COMPLETE SPECIFICATION ACCEPTED

Notice is hereby given that any person interested in opposing the grant of a patent on any of the applications concerned, may, at any time within four months from the date of this issue or within such further period not exceeding one month if applied for on Form 4 prescribed under the Patent Rules, 2003 before the expiry of the said period of four months, give notice to the Controller of Patents at the appropriate office on the prescribed Form 7 of such opposition. The written statement of opposition should be filed in duplicate alongwith evidence, if any, with said notice or within two months from the date of notice of opposition prescribed in Rule 57 as amended by the Patents Rules, 2003.

The Classification given below in respect of each specification are according to Indian Classification and International Classification Systems.

In the event of non-availability of printed specification, photocopies of the specification and drawings, if any, can be supplied by the Patent Office and its branch offices on payment of prescribed photocopy charges @ Rs. 4/- per page of such document.

12 CLAIMS.

A lighting system with an incoherently emitting radiation source (1; 14), such as a discharge lamp (14) comprising at least partially transparent discharge vessel (2;15) which is closed and filled with a gas filling or open and through which a gas or gas mixture flows and which is made from electrically nonconductive material, electrodes (3,4; 16-20) provided with said vessel and in the proximity of one another, said electrodes (3,4 ; 16-20) separated from one another and from the interior of the discharge vessel (2;15) by

dielectric material (5;21) characterized in that the electrodes are located next to one another in a common place and on a common surface of said dielectric material and are connected in alternating fashion to the poles (23, 24) of a voltage source that delivers a sequence of voltage pulses which are separated by pauses, so that a spatial discharge (11;26) is generated in the interior of the discharge chamber (2;15) which has a spacing from the surface of the interior wall of the discharge chamber in the regions between electrodes of different polarity (3,4 ; 16,17 ; 17,18 ; 18,19; 19,20).

21 CLAIMS.

A system having a convolutional decoder for decoding a plurality of pragmatic trellis codes each of which is defined by a series of convolutionally-encoded symbol packets applied as in-phase (I) and quadrature-phase (Q) digital input signals thereto; said plurality of pragmatic trellis codes comprising a distinct code for each constellation set of symbols in the I, Q plane having an even power of 2 number of symbols arranged in a square-grid symbol constellations comprising 2^{2y} symbols, wherein y is a first positive integer having a given value of at least 2; and said convolutional decoder comprises a trellis damper for damping each of said plurality of pragmatic trellis codes; wherein the bit-to-symbol mapping of said square grid of each constellation set is such that alternate cells of odd rows of said square grid define a first subset of symbols, the remaining cells of odd rows of said square grid define a second subset of symbols alternate cells of even rows of said square grid define a third subset of symbols, and the remaining cells of even rows of said square grid define a fourth subset of symbols, and said trellis damper comprises :

An I-channel random access memory (RAM) (400) having an effective depth of $2^{(2x+2)}$ storage locations, wherein X is a second positive integer having a given value larger than said first positive integer, each storage location having an effective width at least sufficient to store an entry of an I-defining lookup table of y-bits;

a Q-channel RAM (402) having an effective depth of $2^{(x-2)}$ storage locations, each storage location having an effective width at least sufficient to store an entry of a Q-defining lookup table of y-bits;

and said convolutional decoder comprises :

means (312) for applying a first x-bit input to said I-channel RAM to define the value of said in-phase (I) digital input signal and for applying a second x-bit input to said Q-channel RAM to define the value of said quadrature (Q) digital input signal;

means (308) for applying a 2-bit input to both said I-channel RAM and said Q-channel RAM to define a selected one of said four subsets in accordance with the binary value of said applied 2-bit input;

a micro controller (204) for preloading said lookup table of said I-channel RAM in accordance with a selected one of said constellation sets of symbols such that the bits mapping the I component of that symbol of the selected one of said four subsets of said selected one of said constellation sets which is closest in value to the value defined by the in-phase (I) digital input signal to said I-channel RAM is read out as the output of said I_channel RAM; and for preloading said lookup table of said Q-channel RAM in accordance with a selected one of said constellation sets of symbols such that the bits mapping the Q component of that symbol of the selected one of said four subsets of said selected one of said constellation sets which is closest in value to the value defined by the quadrature (Q) digital input signal to said Q channel RAM is read out as the output of said Q-channel RAM.

7 CLAIMS.

A directional element for use in a relay (17) for protection of power systems, adapted to obtain zero sequence voltage and current values for a power signal on a power system having known values of zero sequence local source impedance (Z_{SO}), zero sequence line impedance (Z_{LO}) and zero sequence remote source impedance (Z_{RO});

Means (40) being provided for calculating a value (Z_O) representative of a zero sequence impedance for the power system;

Characterized in that said directional element is adapted for establishing a first threshold quantity (Z_{OF}) which is more positive than the zero sequence local source impedance (Z_{SO}) and a second threshold quantity (Z_{OR}) which is less positive than the zero sequence line impedance (Z_{LO}) plus the zero sequence remote source impedance (Z_{RO}), wherein the first threshold quantity (Z_{OF}) is less positive than the second threshold quantity (Z_{OR}); AND

Means (42 & 44) being provided for comparing said calculated values (Z_O) against the first and second threshold quantities (Z_{OR} & Z_{OF}) identify the direction of a fault relative to the relay (17), the first threshold quantity (Z_{OF}) being for a forward fault and the second threshold quantity (Z_{OR}) being for a reverse fault.

Appropriate office for opposition proceeding (Rule 4, Patent Rules2003)

Patent Office Kolkata.

8 CLAIMS.

An apparatus for encoding a contour of an object expressed in a digital video signal, the contour having contour pixels thereon, the apparatus comprising:

a first polygonal approximation block (52) for polygonal-approximating the contour by using a threshold (TH1), wherein the contour is divided into a multiplicity of primary contour segments and each primary contour segment is approximated by a primary line segment joining two end points of said each primary contour segment, a distance between the primary line segment and any contour pixel residing at said each primary contour segment being not greater than the threshold (TH1);

a sampling and error detection block (54) for calculating, for said each primary contour segment, a set of errors which represents a difference between said each primary contour segment and the primary line segment;

a transformation block (56) for performing one-dimensional transform operation on the set of errors to produce a set of transform coefficients;

a quantization block (58) for quantizing the set of transform coefficients to provide a set of quantized transform coefficients;

an inverse quantization block (60-1) for inverse-quantizing the set of quantized transform coefficients to provide a set of reconstructed transform coefficients;

an inverse transformation block (60-2) for inverse-transforming the set of reconstructed transform coefficients to generate the set of reconstructed errors;

a contour reconstruction block (60-3) for providing a reconstructed contour segment based on the set of reconstructed errors and said each primary contour segment;

a reconstruction error calculation block (60-4) for determining a reconstruction error representing a difference between said each primary contour segment and the reconstructed contour segment;

a second polygonal approximation block (62) for polygonal-approximating said each primary contour segment based on a threshold (TH2), wherein said each primary contour segment is divided into one or more secondary contour segments and each secondary contour segment is approximated by a secondary line segment joining two end points of said each secondary contour segment, a distance between the secondary line segment and any contour pixel disposed on said each secondary contour segment being not greater than the threshold (TH2);

a second error calculation block (64) for finding an approximation error representing a difference between said each primary contour segment and the secondary line segment(s);

a comparator (66) for comparing the reconstruction error and the approximation error and for providing a first control signal if the reconstruction error is smaller than the approximation error and a second control signal, if otherwise;

a switch (68) for, in response to the first control signal, providing the set of quantized transform coefficients from the quantization block (58) and, in response to the second control signal, cutting off the path leading from the quantization block (58);

a VLC(variable length coding) block (70) for coding the set of quantized transform coefficients from the switch (68) to provide VLC code data for said each primary contour segment;

a first multiplexor (72) for, in response to the first control signal, providing primary vertex data from the first polygonal approximation block 52 and, in response to the second control signal, providing secondary vertex data from the second polygonal approximation block (62);

a vertex coder (74) for coding the primary vertex data or the secondary vertex data by using arithmetic coding technique; and

a second multiplexor (76) for multiplexing the coded vertex data from the vertex coder 74 together with the VLC coded data from the VLC block (70).

6 CLAIMS.

Transmission system, operating according to a code-modulated transmission method, for transmitting information between a base station (BS) and a multiplicity of subscriber station (MS) in transmission channels of a broadband signal, which transmission channels can be distinguished by means of different code (C_s, C_1, \dots, C_q) which modulate the broad band signal and which themselves are each modulated by the information to be transmitted in the respective transmission channel and are superimposed in the broad band signal, characterized in that the base station (BS) is constructed in such a way that at least one of the transmission channels (for example C_s) is emphasized as prioritized transmission channel, in comparison with the other transmission channels (C_1, \dots, C_q) by the said base station (BS), by virtue of the fact that the phase angle of the said transmission channel is shifted by a fixed amount in comparison with the phase angle of the other transmission channels, and in that the subscriber stations (MS) each have detection means (MFCs, MIX1, MIX2, COMP; MFC1, ..., MFCq, MIX4) which are constructed in such a way that they detect initially at least some of the codes (C_s, C_1, \dots, C_q) in accordance with the phase angle, and the information transmitted is then recovered from the respective code.

PATENT OFFICE KOLKATA.

10 CLAIMS.

An energy efficient driver circuit for driving a display panel having panel electrodes and panel capacitance, said driver circuit comprising:

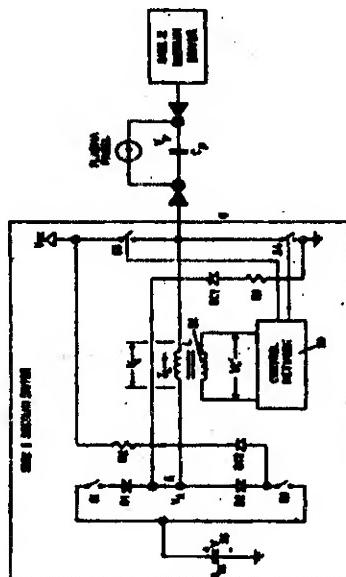

Inductor means (L) having a first terminal and a second terminal, said second terminal connectable to said panel electrodes;

Driving voltage source means (Vss) for providing a driving voltage reference to a common potential;

Voltage supply means (Vcc) for providing a supply voltage referenced to said common potential, wherein said supply voltage is of a magnitude which is greater than said driving voltage;

First switch means (S1) for enabling and disabling a conductive path from said driving voltage source means to said first terminal in response to an input signal transition, said input signal transition commencing a first state wherein, during an enabling of said conductive path, a current flow occurs through said inductor means to charge said panel capacitance, said inductor means causing said panel electrodes to achieve a voltage magnitude in excess of said driving voltage, at which point said current flow reaches zero;

Second switch means (S3), connectable to said panel electrodes, for enabling and disabling a conductive path from said voltage supply means to said second terminal and said panel electrodes; and

switch control means (20) coupled to said inductor means and responsive to said current flow therein, said switch control means operative during at least a portion of said first state to control said second switch means to disable conduction there through, and thereafter in response to a signal derived from said inductor means, to control said second switch means to enable conduction there through at about the time said current flow reaches zero, whereby said voltage supply means, during a succeeding second state, supplies current to both said panel electrodes and flyback current to said inductor means.

An absorbent structure comprising a body facing liquid acquisition layer and a fluid impermeable, fluidly adaptive component which is adjacent to and in dynamically responsive contact with the liquid acquisition layer, wherein the fluid impermeable, fluidly adaptive component is responsive to pressure applied to the component such that when pressure is exerted on a first portion of the fluidly adaptive component, a volume of fluid in the first portion flows to a second portion of the component to expand the second portion and thereby urge at least a portion of the liquid acquisition layer which is adjacent to the second portion of the fluidly adaptive component towards a wearer of the absorbent structure.

A process for preparation of fosinopril sodium of formula (I)

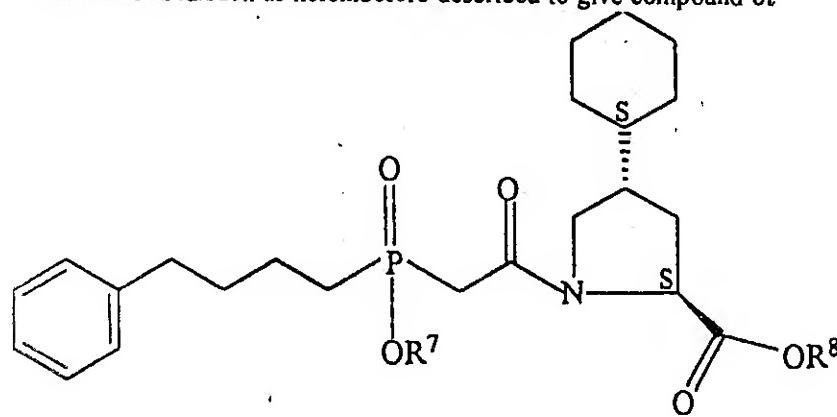

In polymorphic Form-A, which comprises
 a) i) reacting a compound of formula (IV)

Wherein R7 is lower alkyl of 1-4 carbon atoms with (trans)-4-cyclohexyl-L-proline or salt thereof
 of formula (V)

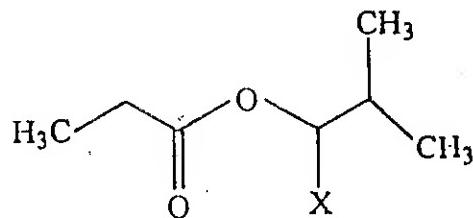

Wherein R⁸ is a group easily removable by hydrogenolysis and is benzyl or benzyl substituted at ortho, meta or para positions by an alkyl, alkoxy, alkanoyl, phenyl, nitro or dialkylamino group in the presence of a solvent of the kind such as hereinbefore described and a base of the kind such as hereinbefore described to give compound of formula (VI)

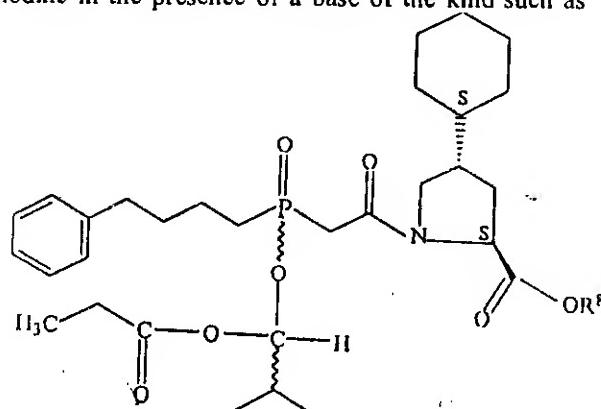

Wherein R⁷ and R⁸ are as defined above.

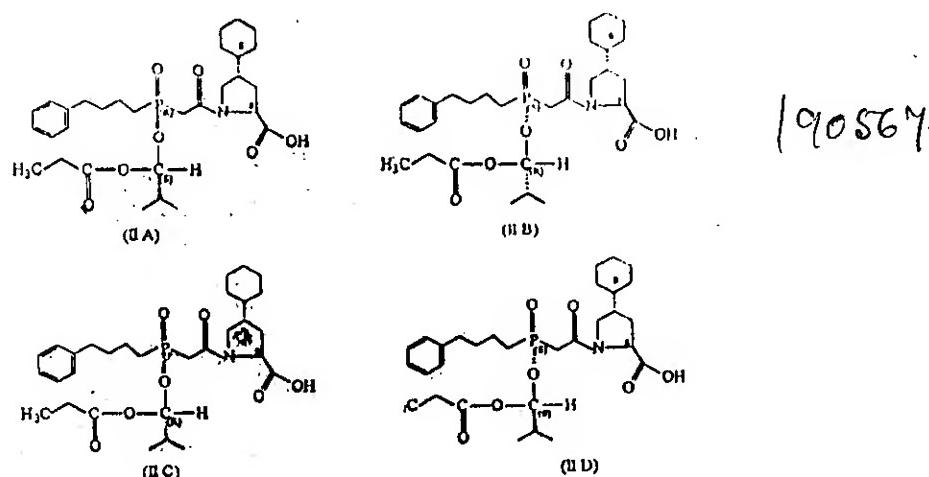

- ii) hydrolysing the alkyl group R⁷ in compound of formula (VI) by reaction with a silyl compound of the kind such as hereinbefore described in presence of a alkali metal halide and a solvent of the kind such as hereinbefore described to give compound of formula (VI), wherein the group R⁷ is hydrogen and R⁸ is as defined above
- iii) reacting compound of formula (VI) wherein R⁷ is hydrogen and R⁸ is as defined above with a compound of formula (VII)

Wherein X is halogen selected from chlorine, bromine and iodine in the presence of a base of the kind such as hereinbefore described to give compound of formula (II^b)

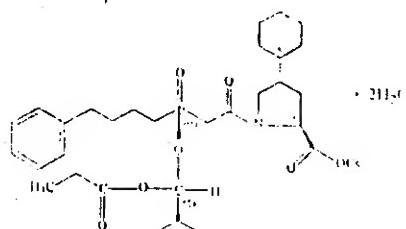

- (iv) deprotecting the group R⁸ in compound of formula (II^b) by reacting it with hydrogen in presence of palladium on carbon as catalyst in presence of a solvent of the kind such as hereinbefore described to give fosinopril as a mixture of four diastereomers (II A), (II B), (II C) and (II D).

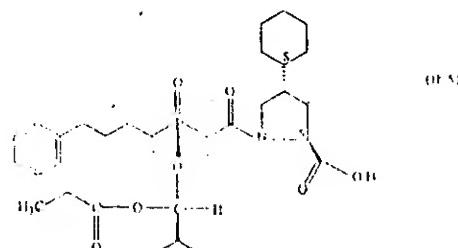

b) separating fosinopril diastereomer (II A) from the mixture of four diastereomers (II A), (II B), (II C) and (II D) by

- iv) mixing together losinopril mixture of four diastereomers (II A), (II B), (II C) and (II D) with a cesium metal carrier in the presence of a solvent of the kind such as herein described and crystallisation of the mixture of cesium salts thus formed in the same solvent or a mixture of solvents containing 1-10 moles of water with respect to compound (II A)/(II B)/(II C)/(II D) to give compound of formula (III A)

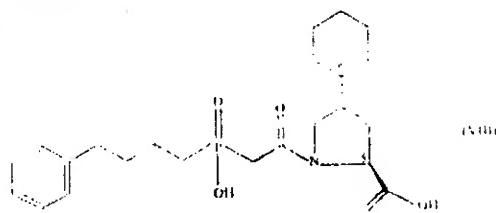

v) reacting compound of formula (III A) with an acid of the kind such as herein described in the presence of a solvent of the kind such as herein described and water to give the fosinopril diastereomer (II A)

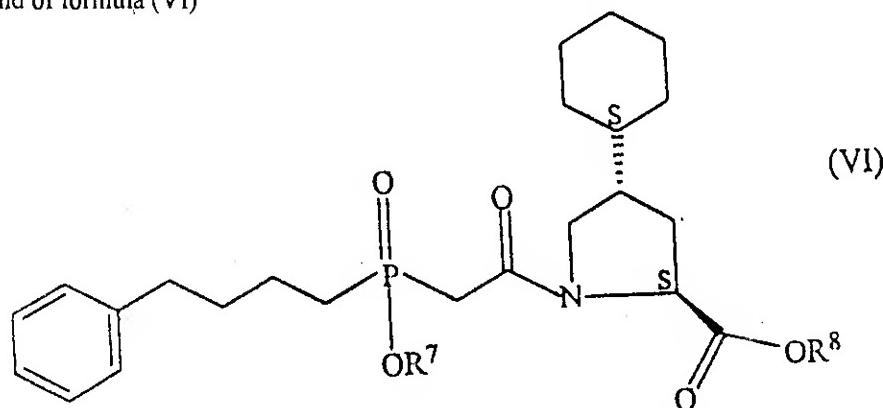

c) converting cesium salts of diastereomers (II B), (II C) and (II D) contained in the waste stream obtained in Step (b), (v) to compound of formula (II A) by

- vii) hydrolysing the mixture of diastereomers (II B), (II C) and (II D) contained in the waste stream of Step (b), (v) to give compound of formula (VIII)

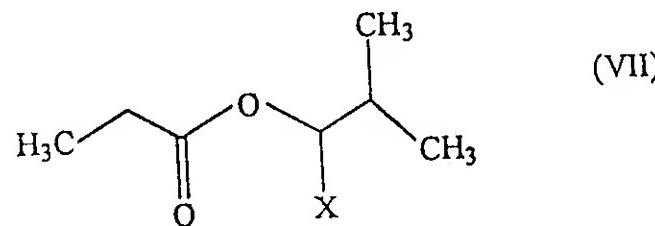

viii) selective esterification of the carboxylic acid group in compound (VIII) in presence of a base of the kind such as herein described or an acid of the kind such as herein described and in presence of a solvent of the kind such as herein described to give compound of formula (VI)

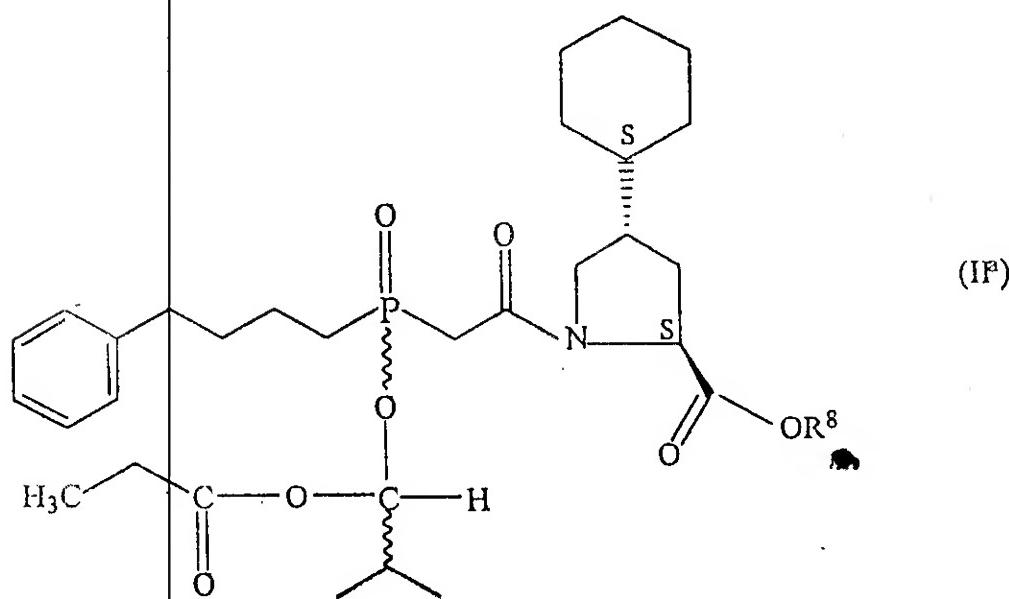

wherein R⁷ is hydrogen and R⁸ is a group removable easily by hydrogenolysis as defined above.

(ix) reacting the compound of formula (VI) with a compound of formula (VII)

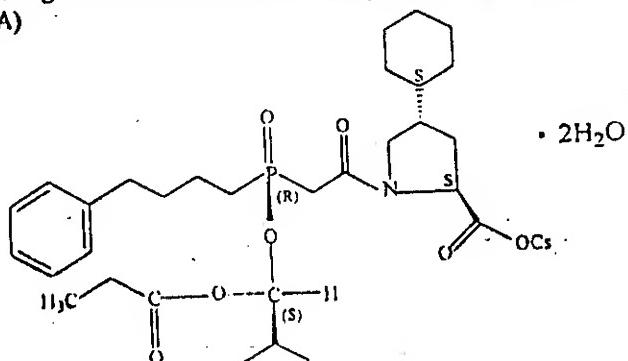

In the presence of a base of the kind such as herein described and a solvent of the kind such as herein described to give compound of formula (II^a)

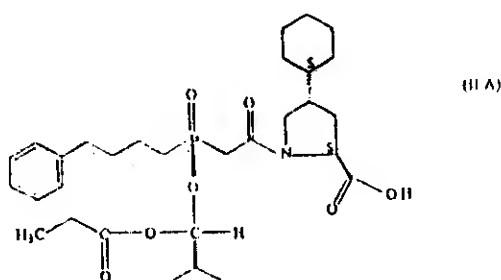

x) deprotection of the group R in compound of formula (II) by reacting with hydrogen in presence of palladium on carbon as catalyst in presence of a solvent of the kind such as herein described to give fosinopril as a mixture of four diastereomers (II A), (II B), (II C) and (II D).

xi) mixing together fosinopril mixture of four diastereomers (II A), (II B), (II C) and (II D) with a cesium metal carrier in the presence of a solvent of the kind such as herein described and crystallising the mixture of cesium salts thus formed in the same solvent or a mixture of solvents containing 1-10 moles of water with respect to compound (II A) / (II B) / (II C) / (II D) to give compound of formula (III A)

xii) reacting compound of formula (III A) with an acid of the kind such as herein described in the presence of a solvent and water to give the fosinopril diastereomer (II A)

d) conversion of compound (II A) to fosinopril sodium polymorphic Form-A by

xiii) mixing together compound (II A) with a sodium metal carrier in presence of a solvent or a mixture of solvents to fosinopril sodium of formula (I) and

xiv) crystallisation of the fosinopril sodium of formula (I) thus formed in the same solvent or mixture of solvents containing water content <0.20% to give fosinopril sodium polymorphic Form-A.

7 CLAIMS.

A communication system configured with the elements of a GSM mobile radio system for the transmission of packet data from mobile station to base station and for determining a time advance for the transmission time from the mobile station, the mobile radio system being operated using the time division multiplexing, said system comprising mobile stations provided with a transmitter for transmitting a test packet to the base station and

Base stations provided with a receiver for receiving said test packet, a timing advance circuitry for determining timing advance after certain decision criteria with respect to the time between timing advance determination, a timing control circuitry and a transmitter for transmitting the determined timing advance to the mobile station;

Characterized in that,

Said timing control circuitry (21) of said mobile stations comprises means (22) for providing a guard time to the data packets transmitted by said mobile stations, said guard time being less than the maximum permissible signal propagation time between said mobile stations and said base station.

A tire mold for completely curing an uncured tire, comprising :

a top mold section and a bottom mold section separable from said top mold section about a mold centerline, said top mold section moveable with respect to said bottom mold section from an open position to a closed position;

said top mold section comprising a container top which contains a plurality of arcuate top tread segments arranged in a first circular pattern about a first axis passing through a center of said first circular pattern and extending generally perpendicular thereto, each of said arcuate top segments coupled to said container top by a top biasing mechanism which forces each of said arcuate top tread segments radially outward from said first axis when said mold is in said open position;

said bottom mold section comprising a container bottom which contains a plurality of arcuate bottom tread segments arranged in a second circular pattern generally parallel to said first circular pattern, said first axis passing through a center of said second circular pattern, each of said arcuate bottom tread segments coupled to said container bottom by a bottom biasing mechanism which forces each of said arcuate bottom tread segments radially outward from said first axis when said mold is in said open position;

wherein said plurality of arcuate top tread segments meet at a first set of junctions when said mold is in said closed position and said plurality of arcuate bottom tread segments meet at a second set of junctions when said mold is in said closed position, none of said first set of junctions aligning with any of said second set of junctions when said mold is in closed position.

An electro-hydraulic operating system for an extensible boom, said boom having at least three telescoping sections, comprising:

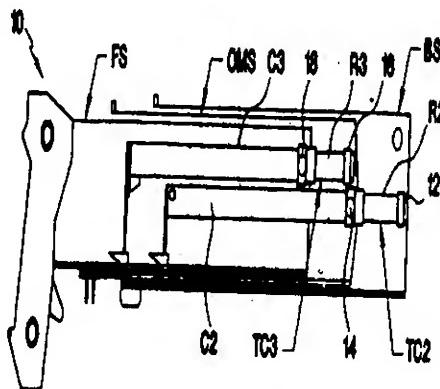

At least two fluid motors coupled to the boom sections for imparting relative motion therebetween to extend or retract the boom;

A source of pressurized hydraulic drive fluid for powering the motor; and

Valve means associated with each of the fluid motors, each valve means, coupled to a master control valve and in fluid communication with the source of fluid and the associated fluid motor, for selectively supplying the pressurized hydraulic drive fluid to the associated fluid motor in response to electrical control signals;

Each valve means comprising,

A solenoid valve, in fluid communication with the source of pressurized hydraulic drive fluid and the associated fluid motor, having an input for receiving electrical control signals from an electronic control means with variable characteristics proportional to desired speeds of movement of the boom section driven by the fluid motor, said solenoid valve varying the pressure of the drive

fluid available for application to the associated fluid motor, and outputting variable pressure pilot signals; and

A metering valve, associated with each valve means , for receiving the variable pressure pilot signals output from said solenoid valve of the associated valve means and supply the hydraulic drive fluid to the associated fluid motor at flow rates proportional to the variable pressure pilot signals.

A process for preparing anthrax antigen comprising:

- transforming *E.coli* DH5 α cells with the recombinant constitutive expression plasmid containing the PA gene to produce the recombinant DH5 α cells expressing the PA protein,
- growing said recombinant DH5 α cells and testing the PA expression by lysis of said cells followed by denaturing gel electrophoresis and Western Blotting technique using PA antibodies,
- fermenting said cells in a bio-reactor using:
 - polyols, carbohydrates or organic acids as primary supplements in Luria Broth medium at 32-42°C,
 - fed batch culture technique, and
 - pH DO stat method of sensing nutrient deprivation to produce high cell density culture expressing PA protein,
- harvesting said cells by centrifugation of said high cell density culture at 5000-10,000 rpm for 10-30 minutes,
- solubilizing said high density cell culture cells by using 6-8 Molar Urea solution and stirring at ambient temperature for 1-2 hours,
- separating said high cell density culture debris by centrifugation at 10,000-15,000 rpm for 30-60 minutes 32-42°C and collecting the supernatant containing urea denatured PA,
- isolating said urea denatured PA from said supernatant and purifying it by Ni-NTA chromatography by gradual removal of urea while said PA is bound to the affinity column, and eluting said purified renatured PA and storing protective antigen (PA) protein as frozen aliquots at -20 to -70° depending upon immediate or long term use.

(Claims 3)

A process for the production of titanium matrix composites comprising:-

- a) preparing a mixture of reactive powders as herein described in stoichiometric proportion, to form the required volume fraction of second phase reinforcements;
- b) compacting the reactive mixture to a density level where once ignited the reactants are completely converted to products; and then
- c) igniting said compacts with the help of a small pool of matrix titanium (metal/alloy/intermetallic) as herein described and permitting the exothermic heat of the compact to further melt the surrounding matrix and uniformly distribute the products of said compact so as to get said titanium matrix composites.

(08 Claims)

An aqueous thickened alkali metal hypochlorite composition comprising:

(a) from 0.5 weight % to 10 weight % of an alkali metal hypochlorite;

(b) from 0.5 weight % to 2.5 weight % of a tertiary amine oxide of the formula:

wherein R¹ is an alkyl group containing from 10 to 16 carbon atoms and R² is a lower alkyl group containing from 1 to 3 carbon atoms;

(c) an alkali metal salt such as herein described present in an amount of from 0.1 to 5% to reduce degradation of the alkali metal hypochlorite;

(d) a pH stabilizer such as herein described preferably present in an effective amount to adjust the pH level of said composition to at least 11;

(e) optionally comprising up to 2 weight % of an alkali metal sarcosinate of formula RCON(CH₂)COOM where R is a straight or branched chain C₁₀ - C₁₆ alkyl group and M is an alkali metal cation;

(f) from 0.1 weight % to 0.8 weight % of an alkali metal C₁₀ - C₁₆ straight chain alkyl benzene sulfonate; and

(g) optionally a hypochlorite stable fragrance; and the remainder is water;

wherein the molar ratio of said (b) - tertiary amine oxide : said (f) - alkyl benzene sulfonate ranges from 5:1 to 11:1.

1. A process for the preparation of block copolymer compositions, comprising (a) for a major part of linear triblock copolymers, comprising two terminal predominantly poly (monovinylaromatic) blocks having a real molecular weight in the range of from 5,000 to 25,000 and one predominantly poly(butadiene) midblock, said triblock copolymer having a monovinylaromatic content in the range of from 10 to 55 wt %, based on the total weight of block copolymer, an apparent total molecular weight in the range of from 15,000 to 300,00, and (b) an amount of from 0 to 40 wt %, of a diblock copolymer relative to the total block copolymer composition weight, containing a predominantly poly (monovinylaromatic) block and a predominantly poly(butadiene) block similar to those of the triblock copolymer component; said block copolymer composition having a free poly (vinylaromatic) content of at most 7 wt%, and wherein the poly(vinylaromatic) endblocks in the block copolymer components have a molecular weight distribution $M_w/M_n \leq 1.15$, comprising the steps:

(1) polymerizing predominantly styrene monomer, optionally mixed with no more than 5 wt% of other comonomers selected from monovinylaromatic monomers and/or conjugated diene monomers in an inert hydrocarbon solvent, of the kind as herein described in the presence of a monoaliphatic organolithium initiator until substantially complete conversion of the monomers;

- (2) adding predominantly 1,3-butadiene optionally mixed with no more than 5 wt% of other comonomers selected from monovinylaromatic monomers and/or conjugated diene monomers to the polymerization mixture and allowing said predominantly butadiene monomer to polymerize until substantially complete conversion;
- (3) adding a second portion of the monovalent organolithium initiator, followed by the addition of a second portion of predominantly butadiene and allowing said monomer to polymerize until substantially complete conversion;
- (4) adding a randomizing agent of the kind as herein described in an amount of 0.01 to 10% by volume;
- (5) adding a second portion of predominantly styrene monomer and allowing said monomer to polymerize until substantially complete conversion;
- (6) adding a proton donating terminating agent selected from water, alcohols, hydrogen, and monoglycidylethers, which is used in a molar ratio versus initiator of at least 1:1; and
- (7) recovery of the block copolymer composition in a known manner ;
wherein the amount of styrene used in steps (1), (2), and as other comonomer used in steps (3) and (5) comprise an amount of from 10 to 55 wt% basis the total monomer weight, and wherein the amount of 1,3-butadiene used in steps (2), (3) and as other comonomer used in steps (1) and (5) comprise an amount of from 90 to 45 wt% basis the total monomer weight; and
wherein the amount of monovalent organolithium initiator used in steps (1) and (3) comprises an amount of from 0.01 to 100 milimols per 100 grams of total monomer, and wherein from 0 to 40% of the total initiator amount is used in step (3).

wherein

R_3 is linear or branched C_1-C_{12} alkyl, cycloalkyl having from 3 to 8 ring carbon atoms; heterocycloalkyl bonded via a carbon atom and having from 3 to 8 ring atoms and 1 or 2 hetero atoms from the group O, S and NR₆; a C_7-C_{16} aralkyl bonded via an alkyl carbon atom, or C_1-C_{12} alkyl substituted by the mentioned cycloalkyl or heterocycloalkyl or heteroaryl; or where:

R_3 is C_6-C_{12} aryl, or C_4-C_{11} heteroaryl bonded via a ring carbon atom and having 1 or 2 hetero atoms in the ring; R_3 being unsubstituted or substituted by -CN, -NO₂, F, Cl, C_1-C_7 alkyl, C_1-C_{12} alkoxy, C_1-C_{12} alkylthio, C_1-C_7 haloalkyl, -OH, C_6-C_{12} aryl or -arylkxy or -arylthio, C_7-C_{16} aralkyl or -aralkoxy or -aralkylthio, secondary amino having from 2 to 24 carbon atoms, -CONR₄R₅ or by -COOR₄, and the aryl radicals and the aryl groups in the aralkyl, aralkoxy and aralkylthio in turn being unsubstituted or substituted by -CN, -NO₂, F, Cl, C_1-C_4 alkyl, -alkoxy or -alkylthio, -OH, -CONR₄R₅ or by -COOR₄; F₄ and R₃ are each independently of the other hydrogen, C_1-C_{12} alkyl, phenyl or benzyl, or R₄ and R₃ together are tetra- or penta-methylene or 3-oxapentylene; R₆ has independently the same meaning as given for R₄;

R₁ and R₂ are each independently of the other a hydrogen atom, C_1-C_{12} alkyl or cycloalkyl having from 3 to 8 ring carbon atoms, each of which is unsubstituted or substituted by -O-₄Li, C_1-C_{12} alkoxy, phenoxy, benzyloxy, secondary amino having from 2 to 24 carbon atoms, -CONR₄R₅ or by -COOR₄; C_6-C_{12} aryl or C_7-C_{16} aralkyl that is unsubstituted or substituted as R₃, or -CONR₄R₅ or -COOR₄, wherein R₄ and R₅ are as defined hereinbefore; or

R₁ is as defined hereinbefore and R₁ and R₂ together are alkylene having from 2 to 5 carbon atoms that is optionally interrupted by 1 or 2 -O-, -S- or -NR₆₋ radicals, and/or unsubstituted or substituted by =O or as R₁ and R₂ above in the meaning of alkyl, and/or condensed with benzene, pyridine, pyrimidine, furan, thiophene or pyrrole; or

R₁ is as defined hereinbefore and R₁ and R₃ together are alkylene having from 2 to 5 carbon atoms that is optionally interrupted by 1 or 2 -O-, -S- or -NR₆₋ radicals, and/or

unsubstituted or substituted by =O or as R₁ and R₂ above in the meaning of alkyl, and/or condensed with benzene, pyridine, pyrimidine, furan, thiophene or pyrrole, which comprises the hydrogenation with hydrogen of an imine of the formula I

wherein R₁ to R₃ have the meanings assigned to them above, where the hydrogen pressure is from 5 to 150 bar, and the reaction temperature is from -20 to 100°C,

in the presence of an iridium catalyst as hereinbefore described and with or without an inert solvent as hereinbefore described,

wherein the molar ratio of the imine of the formula I to the iridium catalyst is from 500 000 to 20,

and wherein the reaction mixture contains an ammonium chloride, bromide or iodide, or a metal chloride, bromide or iodide that is soluble in the reaction mixture,

where the ammonium chloride, bromide or iodide, or a metal chloride, bromide or iodide that is soluble in the reaction mixture is used in an amount of from 0.01 to 200 mol%, based on the iridium catalyst,

and wherein the reaction mixture additionally contains an acid in an amount of 0.001 to 50% by weight based on imine to produce said amine.
